

RETINA UK AND RESEARCH

Retina UK is committed to stimulating and funding research to find causes, treatments and ultimately cures for inherited sight loss conditions.

We fund a wide range of ground-breaking projects and programmes into the rare conditions which result in progressive sight loss.

We share the latest news relating to inherited sight loss research to keep families informed and enable them to make informed choices. Find research news from Retina UK at: **RetinaUK.org.uk/news**.

Getting involved in research

People living with inherited sight loss are often keen to take part in studies and trials to support the work of researchers and many find this a positive and rewarding experience.

Those who join the **Retina UK Lived Experience Panel** receive an email from us when we are made aware of participation opportunities such as focus groups, surveys and research projects.

Sign up to Retina UK's Lived Experience Panel at RetinaUK.org.uk/get-involved/lived-experience.

Interaction between those living with inherited sight loss and the research community is essential for progress; it also provides our community with choices about participation, and opportunities to influence the direction of research.

“Because my family’s defective gene is yet to be identified, I am motivated by any part I can play to ensure patients are understood throughout all the processes leading to potential treatments.”
